Determination of this BAC-end sequence was carried out as part of a collaboration with the Buropean Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre Project Grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EST 06-MAR-2002

Determination of this BAC-end sequence was carried out as part of Determination of this BAC-end sequence was carried out as part of Collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fuitfiy.org The BDGP Drosophila please see http://www.fuitfiy.org The BDGP Drosophila melanogaster BAC library was prepared by Kazucyo Googeawa and Maron Mammoser in Picter de Jong's laboratory in the Department Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, Cancer Genetics at the Roswell Park Cancer Institute in Buffalo. EcoRI digestion of Drosophila DNA provided by the BDGP from the EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2: on bw sp. the same strain used for the BDGP's Ind EST libraries. A more detailed description of the library and how to order individual BAC clones the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://Dacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - . This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre drouged up Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            357 ITIGIAIGCGTIGITITITACTAGGAAGAGCTIGIACTITITCTATGACTITAGIGAAGA 416

- Web: www.gemoscope.cos.france (E-Mail: Sequence was carried out as part of a collaboration with the Barkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster agenome using these BACs. For further information please see http://www.fruithy.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Oscegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is mamed RPOI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; or bw sp. the same strain used for the BDGP's and how to order individual BAC clones, the entire library and how to order individual BAC clones, the entire library or filters for hybridization from the BACPAC Resource Center can be location/Qualifiers
                                                                                                                                                                                                                                                                                                                               Drosophila melanogaster genome survey sequence TET3 end of BAC #BACR14E13 of RPCI-98 library from Drosophila melanogaster (fruit fly), genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (centre drough et Qront) and the Drosophila with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0

/clone_"vector: pHOS1; Site_1: Bst I; Constructed at The Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of E. histolytica using a method described by Clark and Diamond, Clark,
C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol.
77:450.). The DNA was mechanically heared to give a fight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith,
H.O. and Venter, J.C. (Making small insert libraries for whole genome shoqeun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

Genomic DNA isolated from broth cultures of E. histolytica
using a method described by Clark and Diamond (Clark,
C.G., and Diamond, L.S. (1993) Entamocba histolytica:
method for isolate identification. Exp. Parasitol.
// Afo.). The DNA was mechanically sheared to give a
// Tight size distribution (-2 kb). The v + i method used for
tight size distribution (-2 kb). The v + i method used for
the library construction is described in detail in Smith,
H.O. and venter, J.C. (Maxhang small insert libraries for
whole genome shotgun sequencing projects. In Genome
Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barall, Oxford University Press, 1999)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

Genomic DNA isolated from broth cultures of E. histolytica using a method described by Clark and Diamond (Clark, C.G., and Diamond, L.S. (1993) Entamoceba histolytica: a method for isolate identification. Exp. parasitol.
77:450.) The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + i method used for tight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

Clones are derived from the Entamoeba histolytica HMI:IMSS sheared

DNA library

Seq primer: M13-Reverse

Class: shotgun

High quality sequence start: 15

High quality sequence stop: 907.

Location/Qualifiers

L. 94

Sequences ABB90526-ABB90715 represent novel proteins from Chlamydia pneumoniae (strain CWL029), and ABL91184-ABL9173 represent DNA encoding them. The proteins are predicted to be immunogenic and may therefore be useful in vaccine production and for diagnostic purposes. Chlamydia pneumoniae is a common cause of respiratory disease in humans, and is also involved in the development of cardiovascular diseases such as atherosclerosis, coronary artery disease, carotid artery stenosis, myocardial infarction, cerebrovascular disease, actic aneurysm, claudication and stroke. The proteins and nucleic acids of the invention may be used in vaccines and pharmaceutical compositions of the invention or treatment of chlamydia compositions, particularly Chlamydia pneumoniae, and the nucleic acids may be used in the detection of chlamydia pneumoniae, and the nucleic acids may be used in the detection of chlamydia ensured sease or blotting techniques for determining Chlamydia pneumoniae gene expression. The present sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel Chlamydia pneumoniae protein useful in the manufacture of a medicament for treatment or prevention of infection due to Chlamydia, preferably Chlamydia pneumoniae, and for diagnostic purposes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1089 BP; 315 A; 249 C; 171 G; 354 T; 0 other;

The present sequence is the cod-5 gene from Caenorhabditis elegans. Cod-5 is the aromatic amino acid hydroxylase that synthesises serrotonin froom precursor Ltryptophan. The cod-5 gene was knocked out to produce mutants precursor Ltryptophan. The cod-5 gene was knocked out to produce mutants completely lacking in serotonin. These mutants were found to have defects in metabolic control. A number of c. elegans proteins that have defects can manalian homologues acting in the insulin signalling pathway were also manmalian homologue of the mammalian by 3 *kinase whilst daf-2 encodes a homologue of the mammalian proceptor. The C. elegans ART kinase and PKB kinase act downstream of insulin signalling The C. elegans PFEN lipid phosphatase homologue, C. c. elegans PFEN lipid phosphatase homologue, C. DAF-18, has been found to act upstream of ART in the pathway. This discovery has enabled mammalian PFEN action to be mapped to the insulin signalling pathway. Conserved DAF monologues and thus to identify individuals with a predisposition towards the development of glucose intolerance conditions,
                                                                                                                                                                                                                                                                                                                                                                                           ds.

The invention relates to a nucleic acid (I) comprising a sequence at least 18 bases in length of a segment of chemically pretreated DNA (II) of genes associated with development selected from 87 genes listed in the specification such as ACCPN, ADRN, or AFDL and comprising one of 350 sequences (ABN7984-ABN8033) or their complements. The invention is sequences (ABN7984-ABN80333) or their complements. The invention is genes (HCX), like diabetes, cancer, applyeis related to homeobox containing genes (HCX), like diabetes, cancer, applyeis related to homeobox containing genes (HCX), like diabetes, cancer, applyeis related diseases related to histone deacetylation, Currarino syndrome, diseases related with the complements of the genes are useful for detecting the methylation state of all Cpd dinucleotides within the 350 sequences or containing the methylatic or state of all Cpd dinucleotides within the 350 sequences or containing the specification of the 350 sequences, (II) and/or their complementary sequences, (II) and/or their complements and sequences as oligomer probes for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs).

Note: The sequence data for this patent did not form part of the printed specification but is based on sequence information supplied to Derwent by the containing specification but is based on sequence information supplied to Derwent by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Caenorhabditis elegans; cod-5; daf-18; insulin signalling pathway; daf-2; ag-1; insulin receptor; pr 3 *kinase; PRB kinase; PRB kinase; PTRN lipid phosphatase; antidiabetic; anorectic; obesity; diabetes; ss.
associated with development genes such as diabetes, comprises a sequence of a segment of chemically pretreated DNA of genes associated with development -

                                                                                                                                                                                                                                                                                                                                                     The present sequence is a Caenorhabditis elegans cod-5 knockout cDNA.

Most of the cod-5 gene has been deleted and this has caused a frameshift in the remaining coding region. Cod-5 is the aromatic amino acid in the remaining coding region. Cod-5 is the aromatic amino acid in the remaining coding region. Cod-5 is the aromatic amino acid hydroxylase that synthesises servicinin from precursor Liryptophan. The cod-5 gene was knocked out to produce mutants completely lackfing in a servicinin. The mutants were found to have defects in metabolic control. A number of C. elegans proteins that have mammalian homologues acting in the insulin signalling pathway were also identified. The C. elegans age-1 cancodes a homologue of the mammalian PI 3 kinase whilst daf-2 encodes a homologue of the mammalian pi 3 kinase whilst daf-2 cancodes a homologue of the mammalian pi 3 kinase whilst daf-2 cancodes a homologue of the mammalian pi 3 kinase whilst daf-2 cancodes a homologue act downstream of insulin signalling stream of the pathway. This discovery has been found to act upstream code was mapped to the insulin signalling pathway. Conserved DAF motific can be mapped to the insulin signalling pathway. Conserved DAF motific can be used to design probes to identify mammalian DAF homologues and thus to identify individuals with a predisposition towards the development of glucose intolerance conditions, such as obesity and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    5

The present invention describes a library of human polynucleotides comprising the sequences given in AA21253 to AA417779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AA212532 to AA21779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an

The invention relates to a nucleic acid, which comprises a segment of the chemically pretreated DNA of genes associated with DNA transcription from one of 346 sequences, and an oligomer, in particular an oligonucleotide or peptide nucleic acid (PNA)-oligomer that hybridises to or is identical to the chemically pretreated DNA of genes associated with DNA transcription. The set of oligomer probes are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleic acids are useful for diagnosing or treating diseases associated with DNA transcription in a chemically pretreated genomic DNA. The nucleic acids are useful for diagnosing or treating diseases associated with DNA transcription (particularly with the methylation status), e.g. adenosine deaminase deficiency, viral infection, retroviral infection, Sazary syndrome, memberological disorders, immunological disorders, where syndrome, tuberoulosis, developmental disorders; psoriasis, sporiasis, syndrome, nucleotion, hypertension, anglogenesis, erythropoiesis, congenital heart disease, HDNR syndrome, and for this patent did not form part of the printed syndrome. Sequence data for this patent did not form part of the printed European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8911 GTGGATGATATATATTGGTGTTATTTTGGTTTTTATTGGTATGGGGGTATTGTTTGTTT 8970
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8971 ATTGTTATTGTGTTTTTTTTTAGATTTTTTATTGAAAAGGAAAGTGAGGGTTAGGTTTAGAG 9030

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to nucleic acids containing a sequence of at least an uncledides of chemically treated DNA of genes associated with DNA repair, and their complements. The invention also relates to nucleic acids comprising at least 18 base pairs of the chemically pretreated DNA of genes associated with DNA repair selected from PMSZLL, PMSZLL, PMSZLLS, PMSZLLS, PMSZLLS, PMSZLS, MSHY, MSHZ, NUCHI, TDG, INPPLI, RFC4, DDITIL, FANCB, Or XRCC8. Nucleic acids of the invention and related oligomers, are useful for diagnosis of diseases associated with gene or pair, specifically attaxia telanglectasia, aging, Bloom's syndrome, cockayne syndrome, Nijmegen breakage syndrome or Werner syndrome, communodeficiency, trichthiodystrophy, Fanconi's aneamla, solid tumours and cancer, particularly by determining status of cytosine methylation and/or by detecting single-nucleotide polymorphisms. Determination of individual methylation patterns may allow development of individualised therapies. The sequences given in records ABU52192-ABL92335 represent commically pre-treated DNA fragments from genes associated with DNA context is sequence data for this patent is not represented in the specification, but is based on sequence information supplied by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          944 ATGATTCGGTAGTAGGAATATGGGGTCGAGTATGCACGTTGGAGTGATTGGCTGTTCTGG 1003

The invention relates to nucleic acid sequences comprising at least 18 bases of a chemically pretreated gene associated with gene regulation, selected from 94 genes (ABL49301-ABL49394) and/or complementary sequences associated with DNA replication, CENPB, DNA2L, ATR, CHDIL, ERCC3, SNRPAL, RAD50 and Ling2. The chemical pretreatment converts cytosine bases unmethylated at the 5-position to uracil or another base with hypridisation behaviour dissimilar to cytosine, to enable analysis of cytosine methylations. The DNA sequences and method are useful in the cytosine methylations. The DNA sequences and method are useful in the cytosine methylations. The passociated with DNA replication and in therapy of such diseases, by enabling analysis of the cytosine methylation patterns of such genes. They are especially useful in diagnosis and therapy of such diseases, by enabling analysis of the cytosine methylation patterns of such genes. They are especially useful in diagnosis and therapy of eigh Ataxia telangiectasia, ATR-X, Bloom's syndrome, solid tumours and cancer.

CNOTE: The sequence data for this patent did not form part of the printed specification and was supposed to be available directly from WIPO at the vipo. Intrypub/published_pet_sequences. However, the sequence data did not correspond to that referred to in the specification. The present data is taken from EPO data for the patent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ä

Also described are: (I) a recombinent vector (II) containing (I); (2) a transformant (III) containing (II); (3) a genomic DNA of Buchnera sp. containing the sequence given in ABA92787; (4) a plasmid derived from Buchnera sp. containing DNA (c) or (d), (c) is a DNA containing a fully defined sequence given in ABA92789 and (d) is a plasmid which hybridises with a DNA; and (5) a method for the preparation of a protein in which (III) is cultured and
                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
related oligomers, are used to evaluate the methylation status and/or single-nucleotide polymorphisms, in andiogenesis-related genes, for diagnosis and treatment of eye diseases, proliferative retinopathy neovascular glaucoma, solid tumours, inflammation, rheumatoid arthritis, dlabette retinopathy, macular degeneration caused by neovascularisation, psoriasis, arteriosclerosis, inflammatory bowel diseases, ulcers and crohn's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     834 TCTTTGATAATGACAGAAGATGAACAAGAGTAAGTTTTTGAAAAATTCTAAAATAGAAA 893

                                                                                                                                                                                                                             The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Albrimer's disease, AlbS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                0;
                                                                                                                            Sequences AAS45296-AAS45520 represent chemically pretreated genomic DNA molecules associated with the cell cycle and specific PCR primers of the invention. The sequences are useful for detecting the methylation state of all CPG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for flagnosis and/or prognosis events which are disadventageous to patients. The sequences of the invention are useful for the diagnosis and therapy of HIV infection, neurodegenerative disorders, graft-versus-host disease, arteriosclerosis, solid tumours and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        972 AGTATGCACGTTGGAGTGATTGGCTGTTCTGGAAGAACAGGGAAAGTGATTGTCTCAGCT 1031

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Albriemer's disease, ADS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA transcription associated gene; peptide nucleic acid; PNA-oligomer; PNA, cytosine methylation state; SNP; retroviral infection; gene; ds; single nuclectide polymorphism; adenosine deaminase deficiency; cancer; viral infection; Sezuy syndrome; haematological disorder: tuberculosis; immunological disorder: Werner syndrome; developmental disorder; psoriasis; Rieger's syndrome; neurological disorder; erythropolesis; neurodegenerative disorder; wardenburg syndrome; Niemann-Pick disease; mayelodysplastic syndrome; wyocardial infarction; hypertension; arthritis; angiogenesis; congenital heart disease; HDR syndrome; gene therapy; polyglutamine disorder; solid tumour.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δλ
                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a nucleic acid, which comprises a segment of the chemically pretreated DNA of genes associated with DNA transcription from cone of 346 sequences, and an oligomer, in particular an oligomer theory or peptide nucleic acid (PNA)-oligomer that hybridises to or is identical corrected properties associated with DNA of genes associated with DNA of consistency or to the chemically pretreated DNA of genes associated with DNA of cytosine methylation state and/or shape nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleotide deaminase (particularly with the methylation status), e.g. adenosine deaminase (contribution), retroviral infection, Sezary syndrome, hemmatological disorders, immunological disorders, Mernet syndrome, tuberculosis, developmental disorders, psorlasis, Rieger's syndrome, syndrome, nucleotical disorders, meurodegenerative disorders, wardenburg infarction, hypertreation, andyogenesis, erythropolesis, congenital heart disorders, mandogenesis, erythropolesis, congenital heart consenses, HDNS syndrome, arthritis, polyglutamine disorders, solid tumours cassociated genomic DNA molecules of the invention.

Concern Sequence data for this patent did not form part of the printed consense before the consense of the consense of the printed of specification but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;
